

Single Barrel Dumper

- the smallest in the industry
- uses a conical tank to ensure 100% transfer
- very mobile to allow it to be stored out of the way when not in use
- allows for easy barrel rinsing if desired
- add more down the road
- pneumatically controlled operation (no electrical required)

Customers can use manual hydraulic lifts, semi-electric lifts, gantry systems, or fork lifts when using the Barrel Dumper.

Dual Barrel Dumper

Nobody likes to handle full barrels! The Dual Barrel Dumper was designed to remove some of this handling pain. Simply bring a full barrel rack over to the system and place it down on the Dual Barrel Dumper. When you do this, the barrel rack will rest on the frame and the 2 barrels will rest on the wheels that allow you to easily spin them around to dump.

Our Dual Barrel Dumper is just 2 of the Singles positioned side by side. Each dumper has its own tank cart to allow you to dump different product at the same time and pump to separate holding tanks or dump the same product and pump them both to the same holding tank.

Just like with the Single, customers can use a wide range of lifting mechanisms with this system but the ideal way is to lift a full barrel rack to truly streamline the process.
